WorkInSync seat-planning case

Executive answer | Computed model, assumptions shown

Answer in one line

Seat range: 1,200 to 1,575. Recommendation: about 1,400 seats (0.7 seats per person), managed with team anchor days, booking soft caps, small overflow capacity, and an 8-week check-in review.

Why 1,200 is only the hard floor

2,000 people x 3 in-office days / 5-day working week = 1,200 average people per day. A facility, however, must cover the busiest weekday. The unknown is how attendance is distributed, not the weekly total.

Scenario sizing

A. Perfectly balanced peak 1,200 | seats 1,260 | 60% / 60% / 60% / 60% / 60%
Policy-assigned days

B. Managed peak 1,300 | seats 1,365 | 50% / 65% / 65% / 65% / 55%
MODELING ASSUMPTION: team anchors / soft cap

C. Unmanaged peak 1,500 | seats 1,575 | 45% / 70% / 75% / 70% / 40%
MODELING ASSUMPTION: free choice / Tue-Thu skew

D. Worst case peak 2,000 | seats 2,000 | 100% / 100% / 100% / 0% / 0%
All choose the same three days

Scenario B and C weekday profiles are modeling assumptions. The practical minimum is 1,260-1,365 seats; unmanaged behavior raises demand to 1,575; 2,000 is the no-hybrid ceiling.

Executive reasoning and recommendation

Policy and booking are the main levers

At 95% confidence (assumption: z=1.645), independent attendance gives about 1,236 people, only 3% above the 1,200 mean. The 1,200-1,575 range is therefore mostly correlated behavior: teams selecting the same weekdays.

Illustrative per-office sizing

Seats cannot be pooled across countries. With the approved illustrative 1,000 / 600 / 400 split, a 65% planning peak and 5% buffer gives:

Office 1: 1,000 people x 65% x 1.05 = 683 seats

Office 2: 600 people x 65% x 1.05 = 410 seats

Office 3: 400 people x 65% x 1.05 = 273 seats

Total: 1,366 seats

Recommendation

Plan about 1,400 seats: roughly a 8% buffer over the managed peak. Aim to stay near the managed pattern, use overflow for spikes, and avoid fitting out the unmanaged case before measuring actual behavior. Pilot at one office, then review peak check-ins, denials, no-shows, co-presence, and CSAT after 8 weeks.

Caveats

UNKNOWN: real office/country split, local working weeks and holidays, actual attendance, collaboration-space usage, lease limits, and available source systems. Desk count is not space planning; meeting and collaboration space need observed room-usage data.

What I would ask the customer

Real headcount per office; local working weeks and holidays; hybrid policy and enforcement; badge, booking and ticket data; collaboration needs; and lease constraints.

Facilities KPI scorecard

Targets are illustrative, to be calibrated after a 4-8 week baseline.

SYNTHETIC / ILLUSTRATIVE scorecard structure. Report by office and country when source data is available. Read utilization with denial rate and CSAT so a full office is not mistaken for a successful workplace.

Space efficiency | Peak-day utilization

Formula: Peak occupied seats / total seats
Data: Check-in or badge data + seat inventory | Weekly | Owner: Facilities
Illustrative target: 80-90%

Space efficiency | Weekday utilization skew

Formula: Max weekday utilization - min weekday utilization
Data: Check-in or badge data | Weekly | Owner: Facilities + leadership policy
Illustrative target: Narrowing over time

Space efficiency | Cost per employee-day in office

Formula: Occupancy cost / employee-days present
Data: Occupancy cost + presence data | Monthly | Owner: Facilities + Finance
Illustrative target: Trending down

Booking quality | Seat denial rate

Formula: Failed booking attempts / booking attempts
Data: Booking records | Weekly | Owner: Facilities
Illustrative target: <2%

Booking quality | No-show rate

Formula: Booked but not checked in / booked
Data: Booking + check-in records | Weekly | Owner: Facilities
Illustrative target: <10-15% with auto-release

Employee experience | Workplace CSAT / eNPS

Formula: Pulse-survey score
Data: Survey | Monthly / quarterly | Owner: Shared with leadership
Illustrative target: >=4/5

Employee experience | Team co-presence

Formula: Team anchor days meeting participation threshold / anchor days
Data: Check-in data + team roster | Monthly | Owner: Shared with leadership
Illustrative target: Improving

Service operations | Ticket SLA adherence

Formula: Tickets resolved within SLA / total tickets
Data: Ticket system | Weekly | Owner: Facilities
Illustrative target: >=95%

Service operations | Repeat-issue rate

Formula: Repeat tickets / total tickets
Data: Ticket system | Monthly | Owner: Facilities
Illustrative target: Down

Safety & compliance | Critical incidents / findings

Formula: Open count and days to close
Data: Incident and audit records | Weekly | Owner: Facilities
Illustrative target: Zero critical open

Sustainability | Energy per occupied seat-day

Formula: kWh / occupied seat-days
Data: Utility meters + presence data | Monthly | Owner: Facilities
Illustrative target: Down vs baseline

Financial | Budget variance / rightsizing savings

Formula: Actual vs plan; space cost avoided
Data: Finance + occupancy data | Monthly | Owner: Facilities + Finance
Illustrative target: Within +/-5%

KPI operating model and rollout

How to use the scorecard

Leading indicators: booking attempts, denials and no-shows. Lagging indicators: CSAT, cost, energy and budget. Facilities controls service delivery and operational data quality; leadership co-owns policy choices such as mandated office days and team anchors.

Four-step rollout

1. Collect baseline: seats, bookings, check-ins/badge swipes, tickets, utilities, surveys, and lease constraints.
2. Pilot staggering: team anchor days and booking soft caps at one office.
3. Review after 8 weeks: check peak use, denials, no-shows, co-presence, CSAT, tickets and cost.
4. Set final targets from the baseline and rightsize gradually; publish office/country scorecards.

Model assumptions

Approved assumptions: 5-day working week, 5% buffer, 95% confidence / z=1.645, and illustrative office split 1,000 / 600 / 400. Scenario B and C profiles are explicit modeling assumptions. All are editable in the workbook.

Claim status

Given in case: 2,000 people, three offices/countries, three in-office days. Computed: all seat counts and statistical margins. Assumption: working week, buffer, split, confidence/z, B/C weekday profiles. Needs customer input: country and source-system facts.
